

# Executive Summary - FNP Sales Analysis Dashboard

## 1. Project Overview

This project focuses on analyzing the sales performance of **Ferns N Petals (FNP)** using an interactive Excel-based sales dashboard. The objective was to transform transactional sales data into actionable business insights across **revenue, orders, customer spending, product categories, occasions, time periods, delivery performance, and geographic demand**.

The dashboard consolidates key sales KPIs and interactive visualizations to help decision-makers understand **where revenue is coming from, which products and occasions drive demand, when customers purchase, and which cities contribute the highest order volumes**.

The analysis covers **1,000 orders**, generating approximately **₹35.21 lakh in total revenue**, with an average customer spend of approximately **₹3,521 per order**.

---

## 2. Key Business Performance

The overall business performance captured in the dashboard can be summarized through four primary KPIs:

| KPI                         | Performance |
|-----------------------------|-------------|
| Total Orders                | 1,000       |
| Total Revenue               | ₹35,20,984  |
| Average Customer Spend      | ₹3,520.98   |
| Average Order-Delivery Time | 5.53        |

The combination of **1,000 orders and ₹35.21 lakh revenue** indicates a strong revenue contribution from the analyzed customer base. The average spend of around **₹3.5K per order** also suggests that FNP's gifting products have considerable order value, creating opportunities for **premiumization and cross-selling**.

---

### 3. Major Insights from the Analysis

#### A. Occasion-Based Revenue

Occasion-driven purchases are a major contributor to FNP's revenue.

The dashboard shows that **Anniversary** generates the highest revenue among the individual occasions, followed by **Raksha Bandhan and Holi**. Birthday and Valentine's Day contribute comparatively lower revenue.

This indicates that FNP's business is strongly influenced by **emotion-led and occasion-based purchasing behavior**.

#### Business implication:

Marketing and inventory planning should therefore be aligned with the **occasion calendar**, with greater focus on high-value occasions such as anniversaries and Raksha Bandhan.

Rather than maintaining a uniform marketing strategy throughout the year, FNP can use **occasion-specific campaigns, personalized recommendations, early-bird offers, and targeted bundles** to capture demand.

---

#### B. Category Performance

The category analysis highlights significant differences in revenue contribution.

**Colors** is the strongest-performing category, generating approximately **₹10 lakh in revenue**. This is followed by **Soft Toys and Sweets**, which also contribute significantly.

On the other hand, categories such as **Mugs and Plants** generate considerably lower revenue.

#### Business implication:

The company can prioritize high-performing categories through:

- Higher inventory availability
- Premium product variants
- Cross-selling
- Occasion-specific bundles
- Personalized recommendations

At the same time, underperforming categories should be evaluated for **pricing, product assortment, customer demand, and promotional effectiveness** rather than being automatically discontinued.

---

## 4. Time-Based Sales Insights

### Revenue by Month

Monthly revenue demonstrates a highly **seasonal sales pattern**.

Revenue experiences significant peaks during **February and August**, while several other months show substantially lower sales.

This suggests that FNP's demand is not evenly distributed throughout the year and is likely influenced by **festivals, celebrations, gifting occasions, and seasonal events**.

#### **Business implication:**

FNP can use historical demand patterns to improve:

**Demand forecasting → Inventory planning → Marketing allocation → Workforce planning → Delivery capacity**

For example, inventory and delivery capacity can be increased ahead of historically high-demand periods rather than reacting after demand has already increased.

---

## 5. Revenue by Order Hour

The hourly revenue analysis shows noticeable fluctuations in customer purchasing behavior throughout the day.

Revenue increases significantly during certain hours, with strong performance visible around the **evening period**, while other hours experience comparatively lower demand.

#### **Business implication:**

This provides an opportunity for **time-based marketing and operational optimization**.

For example:

- Push notifications during high-conversion periods
- Time-sensitive promotional offers
- Increased customer support capacity during peak hours
- Better delivery workforce allocation
- Personalized reminders for customers who typically purchase during specific periods

This can help FNP improve both **conversion rates and operational efficiency**.

---

## 6. Product-Level Performance

The **Top 5 Products by Revenue** analysis shows that products such as:

- **Magnum Set**
- **Quia Gift**
- **Dolores Gift**
- **Harum Pack**
- **Deserunt Box**

are among the highest revenue-generating products.

The **Magnum Set** appears to be the strongest performer within the top-five group.

### **Business implication:**

These products can serve as **hero products** within FNP's digital and physical merchandising strategy.

The company could:

- Feature them prominently on the homepage
- Create bundles around them
- Recommend them during checkout
- Use them in festive campaigns
- Develop premium versions
- Analyze what characteristics make these products successful

At the same time, products with lower revenue should be evaluated based on **sales volume, margins, customer ratings, and repeat purchase behavior** before making assortment decisions.

---

## 7. Geographic Insights

The geographic analysis identifies the cities generating the highest number of orders.

Among the top-performing cities, **Imphal, Dhanbad, and Kavalai** show relatively strong order volumes, while cities such as **Bhatpara, Bilaspur, and North Dumdum** have comparatively lower volumes within the top-10 set.

An important insight here is that demand is distributed across **multiple geographic markets rather than being concentrated in a single city**.

### Business implication:

FPN can use city-level demand patterns to develop a more localized strategy.

For example:

#### High-demand cities

→ Improve inventory availability + faster fulfillment + targeted campaigns

#### Emerging cities

→ Customer acquisition campaigns + localized promotions

#### Low-demand cities

→ Investigate awareness, product availability, pricing, and delivery constraints

This can help optimize **marketing spend and supply-chain resources geographically**.

---

## 8. Delivery Performance

The dashboard reports an average **order-delivery time of 5.53**.

Delivery performance is particularly important for FNP because gifting is highly **time-sensitive**. A delayed delivery can significantly impact customer satisfaction because the product is often purchased for a specific occasion.

Therefore, delivery time should not be treated merely as an operational metric. It can directly influence:

**Customer satisfaction → Reviews → Repeat purchases → Brand loyalty**

A useful next step would be to analyze delivery time by:

- City
- Product category
- Occasion
- Order hour
- Delivery partner
- Order volume

This would help identify the operational factors responsible for delays.

---

## 9. Key Business Takeaways

The dashboard reveals five major strategic insights:

### 1. Occasion-led demand is critical

FPN's revenue is strongly influenced by celebrations and gifting occasions, making the occasion calendar an important driver of sales planning.

### 2. A few categories drive a large share of revenue

Categories such as **Colors, Soft Toys and Sweets** show stronger revenue performance and should receive greater attention in merchandising and promotional strategies.

### 3. Sales are highly seasonal

Revenue peaks during specific months, highlighting the importance of **forecasting and pre-season inventory planning**.

### 4. Customer demand varies by geography and time

City-level and hourly trends provide opportunities for **localized marketing and operational resource allocation**.

### 5. Product-level analysis can improve merchandising

High-performing products can be leveraged as hero SKUs, while weaker products can be evaluated for pricing, positioning, and assortment optimization.

---

## 10. Recommended Business Actions

Based on the analysis, the following actions can be recommended:

### A. Build an Occasion-Based Marketing Calendar

Prioritize campaigns around high-revenue occasions such as:

**Anniversary → Raksha Bandhan → Holi → Birthday → Valentine's Day**

Use customer purchase history to personalize recommendations and offers.

---

### B. Focus on High-Performing Categories

Increase visibility and availability of high-performing categories such as **Colors, Soft Toys and Sweets**.

Introduce:

- Premium variants
  - Bundles
  - Add-on products
  - Personalized gifting options
- 

### C. Improve Seasonal Demand Forecasting

Use historical monthly sales patterns to forecast demand before major peaks.

This can reduce:

- Stockouts
  - Excess inventory
  - Delivery delays
  - Lost sales
- 

### D. Introduce City-Level Marketing Strategies

Instead of using one national strategy, segment cities based on demand:

**High-demand → Retention + premiumization**

**Medium-demand → Acquisition + targeted offers**

**Low-demand → Awareness + market testing**

---

## **E. Optimize Delivery Operations**

Analyze the 5.53 average delivery-time KPI at a more granular level to identify bottlenecks.

The goal should be to reduce delivery time, particularly during **high-volume occasions and peak ordering hours**.

---

## **11. Overall Business Conclusion**

The analysis indicates that FNP operates in a **highly seasonal, occasion-driven gifting market**, where revenue is influenced by a combination of **customer occasions, product categories, time of purchase, geography, and fulfillment performance**.

With **1,000 orders generating ₹35.21 lakh in revenue and an average customer spend of approximately ₹3,521**, the business demonstrates meaningful transaction value. However, the variation across occasions, categories, months, cities, and ordering hours highlights opportunities for more granular decision-making.

The dashboard therefore serves not merely as a reporting tool but as a **decision-support system** that can help FNP move from reactive sales tracking toward **data-driven demand forecasting, targeted marketing, inventory optimization, product prioritization, and delivery improvement**.

Overall, the key opportunity for FNP is to leverage its strong occasion-led demand and high-value customer orders through better personalization, seasonal planning, geographic targeting, and fulfillment optimization.
